

Max Planck Institute for Demographic Research

New data

Frans Willekens

Conference

Population Change and Life Course
Taking Stock and Looking to the Future
Ottawa, 19-20 March 2015

New data

- Individual level data
- Personal attributes: age, sex, marital status, lifestyle
- Activities: occupation, shopping, recreation, travel, commuting
- Expenditures: goods and services (incl. financial, health care)
- Behaviour
- Values, attitudes and opinions: voting behaviour
- Context: address, living conditions
- Social interaction and social network
- Sensors (e.g. health), surveillance cameras
- Data, byproducts of administrative processes, communication and transactions.

New data

- Longitudinal data
- Increased coverage for comparative analysis
 - e.g. IPUMS: 238 censuses of 74 countries. 545million observations (expected: 800 million from 300 censuses in 100 countries in 2018)
 - World Values Study
 - Gallup World Poll
 - Demographic and Health Surveys (DHS): 300 surveys in over 90 countries
 - Health and Retirement Studies: HRS, ELSA (UK), SHARE (Europe), Korea, China, Indonesia, Japan, Mexico, India
 - European Social Survey; US General Social Survey; International Social Survey Programme
- Spatiotemporally referenced data (GPS)

Data collection: research infrastructure

- Data archives
- Data centers
- Data linkage / record linkage
 - Data linkage centres: <http://www.ipdln.org/data-linkage-centres>
- ESFRI (European Strategy Forum on Research Infrastructures) (established in 2002)
http://ec.europa.eu/research/infrastructures/index_en.cfm?pg=esfri
- ESFRI's delegates are nominated by the Research Ministers of the Member and Associate Countries
- Roadmap for pan-European research infrastructures (first: 2006). From selection to implementation.

Data collection: research infrastructure

- **INFRAIA-1-2014/2015: Integrating and opening existing national and regional research infrastructures of European interest**

ESFRI: Distributed, multidisciplinary European infrastructure on **Big Data and social data mining**. This activity should integrate large social data repositories, social data mining methods and tools, and supercomputing facilities for conducting large-scale analytical processing. The proposal should also address training in social data mining, to foster the availability of skilled data scientists

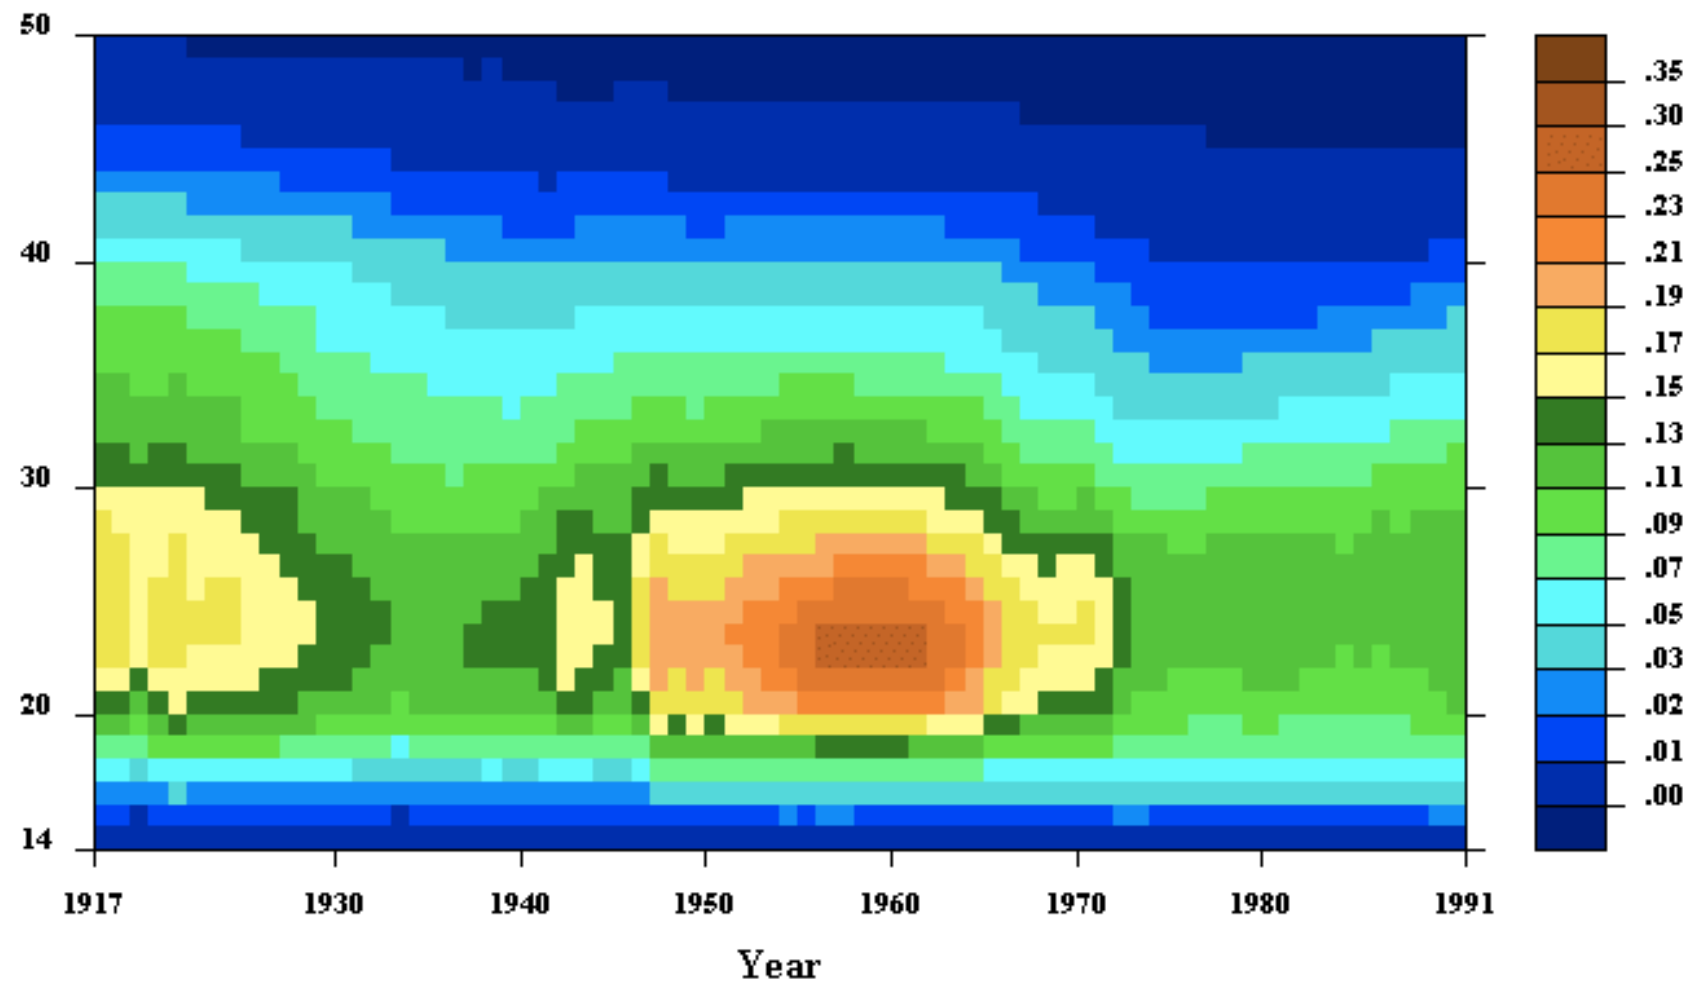

Data analysis: challenges ahead

How to get insight from large amounts of data?

- Pattern recognition
 - Visualisation
- Modeling and simulation
- Life histories (e.g. impact of genes and early life experiences)
- Social interaction

Figure 5. US birth rates selectively placed from 0.001 to 0.35,
and from age 14 to 49 and year 1917 to 1990

Social interaction and emergence of social networks

- Insight from social interaction data
 - How to model social interaction?
 - Use sociological theory more effectively (e.g. emergence of social network from social interaction)
 - Stop segregation in the social sciences
 - Identify main processes (e.g. assortative mixing; homophily)
- Modeling and simulation: Agent-based modeling and computational social science

Conclusion: challenges ahead

- Visualization: produce a picture that reveals patterns and effectively communicates a main message (multimedia?)
- Process models instead of data models (implies simulation)
- Bridge the gap between theory and models: incorporate plausible causal mechanisms in demographic models
- Explore a lingua franca (unifying language) for modeling and simulation in demography
- Transparency in science: open source, documentation and archiving (e.g. CRAN, OpenABM)
- Training: short courses, webinars, YouTube, online courses, regular courses on modeling and simulation

Thank you
