April 1989

Summary

This paper derives the asymptotic expansions of the distribution function of the maximum likelihood estimator (MLE) and the log likelihood ratio (LR) test in a nonlinear regression model. We investigate the effects of nonlinearity of our model on the asymptotic expansions by making use of two kinds of curvature measures: intrinsic curvature and parameter effect curvature defined by Bates and Watts (1980). It is shown that, after suitable transformation, the distribution function of the MLE up to $O(T^{-1})$ is shown to be related to only the parameter effect curvature. The intrinsic curvature appears only in a term of $O(T^{-1})$ in the distribution of LR. Furthermore, we briefly discuss the relationship between the intrinsic curvature and Efron's statistical curvature.

Keywords: Asymptotic expansion, Curvature measures, Log likelihood ratio test, Maximum likelihood estimator, Nonlinear regression.

1. Introduction

We investigate the effects of nonlinearity in a nonlinear regression model on the asymptotic expansions of distribution functions of the maximum likelihood estimator (MLE) and the log likelihood ratio (LR) test by making use of Edgeworth type asymptotic expansions and relative curvature measures of nonlinearity defined by Bates and Watts (1980) (abbreviated as BW hereafter). We deal the following nonlinear regression model:

\[ y_t = f(x_t, \theta) + \varepsilon_t, \quad t = 1, 2, \ldots, T \]

where \( x_t \) is (k×1) vector of independent variables, \( \theta \) is a (p×1) parameter vector, \( y_t \) the dependent variable, and \( f(\cdot) \) the nonlinear response function. We make the following assumptions on \( \varepsilon_t \) and \( f(\cdot) \) to develop asymptotic expansions.

**Assumption 1.** \( \varepsilon_t \) i.i.d. \( N(0, \sigma^2) \), \( t = 1, \ldots, T \).

**Assumption 2.** \( f(x_t, \theta) \) is continuous and differentiable in \( \theta \) up to the necessary order.

Regularity conditions for valid asymptotic expansions in nonlinear regression are discussed in detail by Ivanov (1976). However the proof of validity for asymptotic expansion is beyond the scope of this paper, so we will not discuss it here. Under the normality assumption on \( \varepsilon_t \), the log likelihood function \( \ell(\theta) \) for (1) is written as

\[ \ell(\theta) = -\frac{T}{2} \ln 2\pi - T \ln \sigma - \frac{1}{2\sigma^2} \sum_{t=1}^{T} [y_t - f(x_t, \theta)]^2. \]

The MLE \( \hat{\theta} \) is obtained as a solution of the first order condition
\[
(3) \quad \frac{\partial \ell(\theta)}{\partial \theta_i} = \frac{1}{\sigma^2} \sum_{t=1}^{T} [y_t - f(x_t, \theta)] f^{(i)}_t = 0,
\]

where \( f^{(i)}_t = \frac{\partial f(x_t, \theta)}{\partial \theta_i} \). Furthermore we define

\[
f^{(i,j)}_t = \frac{\partial^2 f(x_t, \theta)}{\partial \theta_i \partial \theta_j}, \quad f^{(i,j,k)}_t = \frac{\partial^3 f(x_t, \theta)}{\partial \theta_i \partial \theta_j \partial \theta_k},
\]

and we assume

**Assumption 3.** The moments of derivatives such as

(a) \( \frac{1}{T} \sum_{t=1}^{T} f^{(i)2}_t \), (b) \( \frac{1}{T} \sum_{t=1}^{T} f^{(i)}_t f^{(j)}_t \), (c) \( \frac{1}{T} \sum_{t=1}^{T} f^{(i)}_t f^{(i,j,k)}_t \), (d) \( \frac{1}{T} \sum_{t=1}^{T} f^{(i)2}_t f^{(j,k)}_t \),

and all sum of products associated 5 times differentiation such

(e) \( \frac{1}{T} \sum_{t} f^{(i,j,k,l,m)}_t \), \( \frac{1}{T} \sum_{t} f^{(j,k,l,m)}_t \), \( \frac{1}{T} \sum_{t} f^{(i,j)}_t f^{(k,l,m)}_t \)

have the order \( O(1) \), where

\[
f^{(j_1,\ldots,j_s)}_t = \frac{\partial^s}{\partial \theta_{j_1} \ldots \partial \theta_{j_s}} f(x_t, \theta).
\]

Note that these assumptions (a)–(e) are for the third order asymptotic expansions. If we are concerned with the second order expansions, (e) can be omitted. (e) assures that the remainder term in stochastic expansion of \( \sqrt{T} (\hat{\theta} - \theta) \) up to \( O(T^{-1}) \) has \( o(T^{-1}) \).
As is easily seen, the MLE $\hat{\theta}$ is the least square estimator (LSE) in the sense that

$$
(4) \quad \sum_{t=1}^{T} [y_t - f(x_t, \theta)]^2
$$

is minimized with respect to $\theta$.

Although the MLE $\hat{\theta}$ has desirable asymptotic properties, it is biased estimator. Box (1971) derived the approximate bias of $\hat{\theta}$ in a more general case where there are more than two response functions but the normality of the error terms are assumed. On the other hand, BW proposed two kinds of measures of nonlinearity: intrinsic curvature and parameter effect curvature in order to investigate the effects of nonlinearity in nonlinear regression models. To have a clear physical and geometrical interpretation of these curvatures, the reader should refer to BW's original paper and/or an excellent exposition by Ratkowsky (1983, p.p. 7–8). BW showed that after a suitable reparameterization, Box's approximation of bias up to $O(T^{-1})$ in the LSE could be expressed only in terms of parameter effect curvature. As a result, they emphasized that "to the extent of Box's approximation, bias is strictly a property of the parameterization". This result naturally leads us to the following questions:

To the extent of Edgeworth type asymptotic expansion, are distributional properties of MLE and LR still related only to the parameter effect curvature? How could the intrinsic curvature affect the distributional properties of them? These questions are the motivations of this paper.

Section 2 of the paper derives the formal asymptotic expansion of distribution function of MLE for a multi-parameter case. Since it was derived by Maekawa and Lu Xianzi (1988), we only show the results omitting the detailed derivations. A supplement for details is available on request. In Section 3, we rewrite the asymptotic expansion formulas in terms of the curvature measures. Section 4 derives asymptotic expansions for MLE and LR, up to $O(T^{-1})$ in terms of curvatures. Section 5 has summary and conclusions.
2. Asymptotic expansion of MLE

Asymptotic expansions of MLE were studied by a considerable number of authors based on different techniques and in different contexts. Among others, the most relevant techniques to us are those in Takeuchi (1974) and Tankiguichi (1986), although the latter author dealt with Gaussian ARMA processes. We shall formally follow their derivation of asymptotic expansion.

Now we introduce the following definitions. Set

\[
Z_1(\theta)' = [Z_{11}(\theta), \ldots, Z_{1p}(\theta)],
\]

\[
Z_{1i} = \frac{1}{\sqrt{T}} \frac{\partial \ell(\theta)}{\partial \theta_i},
\]

\[
Z_{2i} = \frac{1}{\sqrt{T}} \left[ \frac{\partial^2 \ell(\theta)}{\partial \theta_i \partial \theta_i} - \mathbb{E} \left[ \frac{\partial^2 \ell(\theta)}{\partial \theta_i \partial \theta_i} \right] \right] = [Z_{2k}] (p \times p),
\]

\[
I(\theta) = \mathbb{E}[Z_1(\theta)Z_1(\theta)'] = - \frac{1}{T} \mathbb{E} \left[ \frac{\partial^2 \ell(\theta)}{\partial \theta \partial \theta'} \right]
\]

\[
J_{ijk}(\theta) = \text{cov}[Z_{1i}(\theta), Z_{2jk}(\theta)]
\]

\[
\frac{1}{\sqrt{T}} K_{ik}(\theta) = \text{cum}\{Z_{1i}(\theta), Z_{1k}(\theta), Z_1(\theta)\}
\]

\[
R_{ik}\ell(\theta) = \frac{1}{T} \mathbb{E} \left[ \frac{\partial^3 \ell(\theta)}{\partial \theta_1 \partial \theta_k \partial \ell} \right]
\]

where $\text{cum}(x,y,z)$ denotes the third order cumulant of random variables $x,y,z$. Furthermore we need:

**Assumption 4.** The matrix $I(\theta)$ is positive definite for all $\theta$.

Then it can be shown that under Assumptions 1–4, the stochastic expansion of the $j^{th}$ element of standardized MLE $u_j = \sqrt{T}(\hat{\theta}_j - \theta_j)$ is given by
**Theorem 1**

(4) \[ u_j = \sqrt{T} (\hat{\theta}_j - \theta_j) = \sum_{k=1}^{p} \bar{Y}^{1k} - Z_{1k} + \frac{1}{\sqrt{T}} \sum_{u,v,w=1}^{p} I^{jw} \bar{Y}^{uw} Z_{uv} Z_{1w} + \frac{1}{2} \sum_{u,v,w,b,c=1}^{p} \bar{Y}^{1u} R_{uvw} \bar{Y}^{1v} Z_{1b} \bar{Y}^{1w} Z_{1c} + o_p \[T^{-\frac{1}{2}}], \]

where \( I^{ij} \) is the \((i,j)\)th element of \( I(\theta)^{-1} \).

**Proof.** See Taniguchi and Maekawa (1988, Theorem 1).

Taking expectation of (3), it is not difficult to obtain:

**Lemma 1**

(5) \[ E(u_j) = \frac{1}{\sqrt{T}} \sum_{t,w,v=1}^{p} I^{vtw} (I_{vtw} + \frac{1}{2} R_{vtw}) + o \[T^{-\frac{1}{2}} \]

\[ = \frac{1}{\sqrt{T}} c_j + o \left[ \frac{1}{\sqrt{T}} \right], \]

(6) \[ \text{cum} (u_j, u_j') = I^{jj'} + o \left[ \frac{1}{\sqrt{T}} \right] = c_{jj'} + o \left[ T^{-\frac{1}{2}} \right] \]

(7) \[ \text{cum}(u_j, u_j', u_j'', \ldots) = \frac{1}{\sqrt{T}} \sum_{j_1 j_2 j_3 = 1}^{p} I^{jj_1 j_2 j_3} \times \left[ 2K_{j_1 j_2 j_3} + J_{j_1 j_2 j_3} + J_{j_2 j_3 j_1} + J_{j_3 j_1 j_2} \right] + o \left[ T^{-\frac{1}{2}} \right]

\[ = \frac{1}{\sqrt{T}} c_{jj'} + o \left[ T^{-\frac{1}{2}} \right], \]

where the second equality signs in (5), (6), and (7) define \( c_j \), \( c_{jj'} \), and \( c_{jj'} j'' \ldots \).
Using $c_{j}$, $c_{ij}$, $c_{jj}$, $c_{jj'}$, the asymptotic expansion of distribution function of $u_{1}, u_{2}, \ldots, u_{p}$ up to $o\left(T^{-\frac{1}{2}}\right)$, is given by

**Theorem 2**

\begin{equation}
\begin{aligned}
p(u_{1} \leq x_{1}, u_{2} \leq x_{2}, \ldots, u_{p} \leq x_{p}) & = \int_{-\infty}^{x_{1}} \cdots \int_{-\infty}^{x_{p}} g(u, \Omega)[1 + \frac{1}{\sqrt{T}} i H_{i}(u) \\
& + \frac{1}{6\sqrt{T}} \sum_{i,j,k=1}^{p} c_{ijk} H_{ijk}(u)] du + o\left(T^{-\frac{1}{2}}\right),
\end{aligned}
\end{equation}

where $u' = (u_{1}, u_{2}, \ldots, u_{p})$.

\begin{equation}
g(u, \Omega) = (2\pi)^{-\frac{p}{2}} |\Omega|^{-\frac{1}{2}} \exp\left[-\frac{1}{2} u' \Omega u\right], \Omega = \{c_{ij}\}
\end{equation}

and $H_{i}$, $H_{ijk}$ are Hermite polynomial defined by

\begin{equation}
H_{j_{1}j_{2}\ldots j_{s}}(u) = \frac{(-1)^{s}}{g(u, \Omega)} \frac{\partial^{s}}{\partial u_{j_{1}} \cdots \partial u_{j_{s}}} g(u, \Omega).
\end{equation}

**Proof.** The proof of (8) is entirely analogous to that of Theorem 3 in Taniguchi and Maekawa (1988).

If we calculate $c_{i}$, $c_{ij}$, $c_{ijk}$ from our log likelihood function (2). We have the explicit formula in terms of derivatives of $f(x_{i}, \theta)$ with respect to $\theta_{i}$. But since the result would be extremely complicated, we only show the explicit formulas of components of $c_{j}$, $c_{jj'}$, $c_{jj'j''}$, i.e., $I_{ij}$, $J_{ik\ell}$, $K_{ik\ell}$, and $R_{ik\ell}$.
Theorem 3

\[ I_{ij}(\theta) = \frac{1}{T\sigma^2} \sum_{t=1}^{T} f_t^{(i)} f_t^{(j)} \]

\[ J_{ik\ell}(\theta) = \frac{1}{T\sigma^2} \sum_{t=1}^{T} f_t^{(i)} f_t^{(k\ell)} \]

\[ K_{ik\ell}(\theta) = 0 \]

\[ R_{ik\ell}(\theta) = -\frac{1}{T\sigma^2} \sum_{t=1}^{T} \left[ f_t^{(i)} \frac{\partial \ell(\theta)}{\partial \theta_i} + f_t^{(j)} \frac{\partial \ell(\theta)}{\partial \theta_j} + f_t^{(k)} f_t^{(\ell)} \right] \]

Proof. By direct calculation, we immediately obtain

\[ I_{ij}(\theta) = \frac{1}{T} E(\frac{\partial \ell(\theta)}{\partial \theta_i}(\frac{\partial \ell(\theta)}{\partial \theta_i})) \]

\[ = \frac{1}{T\sigma^2} E(\sum_{t=1}^{T} u_t f_t^{(i)})(\sum_{t=1}^{T} u_t f_t^{(j)}) \]

\[ = \frac{1}{T\sigma^2} \sum_{t=1}^{T} f_t^{(i)} f_t^{(j)} \]

Similarly, \( J_{ik\ell}(\theta), K_{ik\ell}(\theta), \) and \( R_{ik\ell}(\theta) \) are easily obtained. \( \square \)

We note that if the model (1) is linear, then \( f_t^{(i,j)} = 0, J_{ik\ell}(\theta) = 0, K_{ik\ell}(\theta) = 0 \) and hence \( c_1 = 0. \) This agrees with the fact that in the standard linear regression model LSE and MLE is unbiased. We also note that if \( p = 1 \) (\( \theta \) is a single parameter), it is easy to see that the bias \( c_1 \) is

\[ c_1 = \frac{\sigma^2}{2} \sum_{t=1}^{T} f_t^{(1)} f_t^{(1,1)} \]

\[ = \frac{-2}{2[\sum f_t^{(1)}]^2} \]

which agrees with Box's (1971, p. 177) bias formula (2.25).
3. Representation in terms of Curvature Measure

This section derives the alternative representation of the asymptotic expansion of distribution function of MLE in Eq.(8) in terms of the curvature measures defined by BW.

To do so we first introduce their curvature measures. Define \((T \times p)\) matrix

\[
V = [v_1, v_2, \ldots, v_p]
\]

whose \(i\)th column is \(v_i:\)

\[
v_i = \left[ \frac{\partial f(x_1, \theta_i)}{\partial \theta_i}, \frac{\partial f(x_2, \theta_i)}{\partial \theta_i}, \ldots, \frac{\partial f(x_T, \theta_i)}{\partial \theta_i} \right]'
\]

\(i = 1, 2, \ldots, p\)

and define the second partial derivative \((p \times p)\) matrix \(\{v_{ij}\}:

\[
\{v_{ij}\} = \left( \frac{\partial^2 f(x_t, \theta)}{\partial \theta_i \partial \theta_j} \right)
\]

\(\theta = \theta_0\)

and collect them into \(p \times p\) matrix of \(T - \)vectors \(V_\cdot\) such as

\[
V_\cdot = \begin{bmatrix}
\{v_{1ij}\} \\
\{v_{2ij}\} \\
\vdots \\
\{v_{Tij}\}
\end{bmatrix}
\]

It can be shown that \(V_\cdot\) has the QR decomposition such that

\[
V_\cdot = QR = Q \begin{bmatrix}
\tilde{R} \\
\vdots \\
0
\end{bmatrix} p \times p
\]

\((T - p) \times p\)

where \(\tilde{R}\) is upper triangular and \(Q\) is an orthogonal matrix, where the first \(p\) column of \(Q\) is \(v_1\), i.e., \(Q = [V_\cdot \; N]\) (see BW (1980, eq.(2.10))

Let \(\eta(\theta)\) be a \((T \times 1)\) vector \(\eta(\theta) = (f(x_1, \theta), f(x_2, \theta), \ldots, f(x_T, \theta))\)

then Taylor expansion of \(\eta(\theta)\) at \(\theta = \theta_0\), up to the second order, is written as
(11) \[ \eta(\theta) = \eta(\theta_0) + \nu. (\theta - \theta_0) + \frac{1}{2} (\theta - \theta_0)'V..(\theta - \theta_0). \]

Now following BW, we reparameterize \( \theta \) to \( \phi \) by

\[ \theta = \mathbf{R}^{-1} \phi = \mathbf{L} \phi \]

and rotate the coordinator of the sample space by orthogonal matrix \( \mathbf{Q}' \). A geometrical interpretation of this rotation is given in BW article in p. 6. By these reparameterization and rotation, Taylor expansion (11) is written

\[ \mathbf{Q}' \eta(\mathbf{L} \phi) = \mathbf{Q}' \eta(\mathbf{L} \phi_0) + \mathbf{Q}' \nu. \mathbf{L} (\phi - \phi_0) + \frac{1}{2} \mathbf{Q}' (\phi - \phi_0) \mathbf{L}' \nu. \mathbf{L} (\phi - \phi_0) \]

where \( \phi_0 = \mathbf{L}^{-1} \theta_0 \).

The last term in rhs of the above formula can be written as a \((T \times 1)\) vector

\[ \frac{1}{2} \mathbf{Q}' (\phi - \phi_0) \mathbf{L}' \nu. \mathbf{L} (\phi - \phi_0) = \frac{1}{2} \begin{bmatrix} (\phi - \phi_0)'A_1.. (\phi - \phi_0) \\ (\phi - \phi_0)'A_2.. (\phi - \phi_0) \\ \vdots \\ (\phi - \phi_0)'A_T.. (\phi - \phi_0) \end{bmatrix} = \frac{1}{2} (\phi - \phi_0)'A.. (\phi - \phi_0) \]

where \( A.. \) is \( T \)-vector of \( p \times p \) matrix:

\[ A.. = \begin{bmatrix} A_1.. \\ A_2.. \\ \vdots \\ A_T.. \end{bmatrix} = \begin{bmatrix} A^T.. \\ A^{N..} \end{bmatrix} \]

where \( A_1.. \) is called ith face of \( A.. \), and \( A^T.. \), \( A^{N..} \) represent the first \( p \) faces and the last \((T - P)\) faces respectively. BW showed that the parameter effect curvature is defined by a linear combination of elements of \( A^T.. \) and the intrinsic curvature by a linear combination of those of \( A^{N..} \).

Now let \( \mathbf{W}_1 \) be a \((T \times p)\) matrix of first order derivative in the \( \phi \)-co-ordinate whose ith column is \( w_1 \):

\[ w_1 = \begin{bmatrix} \frac{\partial \eta_1(\phi)}{\partial \phi_1} & \frac{\partial \eta_2(\phi)}{\partial \phi_1} & \cdots & \frac{\partial \eta_T(\phi)}{\partial \phi_1} \end{bmatrix} \]

and
\[ W. = (w_1, w_2, \ldots, w_p). \]

Similarly we define a \((p \times p)\) matrix \(\{w_{tjk}\}\) of second order derivative where

\[
\frac{\partial^2 \eta_t}{\partial \phi_j \partial \phi_k} = w_{tjk}.
\]

We also define \((p \times p) \times T\) matrix

\[
W = \begin{bmatrix}
\{w_{1ij}\} \\
\{w_{2ij}\} \\
\vdots \\
\{w_{Tij}\}
\end{bmatrix}.
\]

It is easy to see that

\[ W. = V. L \quad \text{and} \quad W. = L^T V. L, \]

where \(W.\) and \(W.\) are counterparts of \(U.\) and \(U.\) in \(BW\) (p.p. 6–7). Using these notations and the definition of \(A^T.\), it can be shown that

\[(11) \quad \text{a typical element of } A^T. = \sum_{t=1}^{T} w_{ti} w_{tjk}.\]

We are now ready to rewrite the asymptotic expansion (8) in terms of elements of \(A.\).

It is not difficult to show the following results:

**Lemma 2.** Let \(S = \sqrt{T} L^{-1}(\hat{\theta} - \theta) = \sqrt{T} (\phi - \phi)\), then cumulants of \(s_1, s_j, s_k\), which are element of \(S\), are written as

\[
E(s_1) = \sum_{t=1}^{T} \sum_{\alpha=1}^{P} w_{t\alpha} w_{t\alpha} + o\left[T^{-\frac{1}{2}}\right] = \bar{c}_1 + o\left[T^{-\frac{1}{2}}\right]
\]

\[
\text{cum} (s_1, s_j) = \bar{c}_{ij} + o\left[T^{-\frac{1}{2}}\right] \begin{cases} = 1 + o\left[T^{-\frac{1}{2}}\right] \text{ for } i = j \\ = 0 + o\left[T^{-\frac{1}{2}}\right] \text{ for } i \neq j \end{cases}
\]
\[
\text{cum} \left( s_i s_j s_k \right) = \sum_{t=1}^{T} (w_{ti} w_{tj} w_{tk} + w_{ti} w_{tik} + w_{tk} w_{tij}) + o\left( T^{-2} \right)
\]

\[
= \tilde{c}_{ijk} + o\left( T^{-2} \right)
\]

**Proof.** See Appendix.

We note that \( \tilde{c}_i, \tilde{c}_{ijk} \) are expressed in terms of elements of \( A^T \), and \( \tilde{c}_{ij} \) is a constant.

Therefore BW's transformation matrix \( L^{-1} \) makes the covariance matrix of \( \sqrt{T}(\hat{\phi} - \phi) \) the asymptotically identity matrix. Applying the general formula of asymptotic expansion, we obtain:

**Theorem 4.** The asymptotic expansion of distribution function of \( S = \sqrt{T} (\hat{\phi} - \phi) \) is given by

\[
P(s_1 \leq z_1, s_2 \leq z_2, \ldots, s_p \leq z_p)
\]

\[
= \int_{-\infty}^{z_1} \cdots \int_{-\infty}^{z_p} g(s, \bar{\Omega}) \left[ 1 + \frac{1}{\sqrt{T}} \sum_{t=1}^{P} \tilde{c}_{t} H_{t}(s) \right]
\]

\[
+ \frac{1}{\sqrt{T}} \sum_{i,j,k} \tilde{c}_{ijk} H_{ijk}(s) ds_1 \cdots ds_p + o\left( \frac{1}{\sqrt{T}} \right)
\]

where \( s = (s_1, \ldots, s_p)' \), \( \bar{\Omega} = \{ \tilde{c}_{ij} \} \) and \( g(s, \bar{\Omega}) \), \( H_{t}(s) \) and \( H_{ijk}(s) \) are defined by (9) and (10).

We notice that, in reparameterizing \( \theta \) to \( \phi \), the distribution function of \( S = \sqrt{T}(\phi - \phi) \) is expressed only in terms of elements of \( A^T \); components of parameter effect. This answers our question and allow us to extend BW's statement in saying that not only bias but also distribution up to \( O\left( T^{-2} \right) \) is strictly a property of the parameterization. More precisely we can say that discrepancy from normality of the approximate distribution of \( \sqrt{T}(\phi - \phi) \) up to \( O\left( T^{-\frac{1}{2}} \right) \) is strictly a property of the parameterization.
4. Third Order Asymptotic Expansions of MLE and LR for p = 1

4.1 Expansion for LR

We consider the problem of testing a null hypothesis:

\[ H : \theta = \theta_0 + \frac{x}{\sqrt{T}} \quad (x > 0) \]

and against an alternative

\[ K : \theta = \theta_0. \]

Likelihood ratio test statistic is defined by

\[ LR = \ell(\theta_0) - \ell(\theta_1), \text{ where } \theta_1 = \theta_0 + \frac{x}{\sqrt{T}}. \]

Following Taniguchi (1986), we derive asymptotic expansion of LR. To do so we introduce the following notations:

\[ Z_1 = \frac{1}{\sqrt{T}} \frac{\partial \ell(\theta)}{\partial \theta} \]

\[ Z_2 = \frac{1}{\sqrt{T}} \left[ \frac{\partial^2 \ell(\theta)}{\partial \theta^2} - E \left( \frac{\partial^2 \ell(\theta)}{\partial \theta^2} \right) \right] \]

\[ Z_3 = \frac{1}{\sqrt{T}} \left[ \frac{\partial^3 \ell(\theta)}{\partial \theta^3} - E \left( \frac{\partial^3 \ell(\theta)}{\partial \theta^3} \right) \right] \]

\[ E \left[ Z_1^2 \right] = I + O(T^{-1}) \]

\[ E \left[ Z_1 Z_2 \right] = J + O(T^{-1}) \]

\[ E \left[ Z_1^3 \right] = \frac{1}{\sqrt{T}} K + O(T^{-\frac{3}{2}}) \]

\[ E \left[ Z_1 Z_3 \right] = P + O(T^{-1}) \]
\[ \text{Var}[Z_2^2] = M + O(T^{-1}) \]

\[ \text{E}[Z_1^2Z_2] = \frac{1}{4T} N + O(T^{-\frac{3}{2}}) \]

\[ \text{cum}(Z_1, Z_1, Z_1, Z_1) = \frac{1}{T} H + O(T^{-2}) \]

\[ \text{E} \left[ \frac{1}{4T} \frac{\partial \ell(\theta)}{\partial \theta} \right]^2 = I(\theta) + \Delta(\theta)/T + o(T^{-1}). \]

We consider a standardized LR as
\[ \left\{ \text{LR} - \text{E}_{\theta_1}(\text{LR}) \right\}/\left\{ x/E[Z_1^2] \right\} \]

To obtain asymptotic expansion, up to \(O(T^{-1})\), we have only to consider an approximation
\[ Y_T = \left\{ \text{LR} - \text{E}_{\theta_1}(\text{LR}) \right\}/(x_{4\sqrt{T}}^2) \]

where \(L_T = I(\theta) + \Delta(\theta)/\sqrt{T}\) and \(\text{LR}^*\) is Taylor approximation:
\[ \text{LR}^* = -x \left[ \frac{\partial \ell(\theta)}{\partial \theta} \right]_{\theta_0} - \frac{x^2}{2T} \left[ \frac{\partial^2 \ell(\theta)}{\partial \theta^2} \right]_{\theta_0} - \frac{x^3}{6T^2} \left[ \frac{\partial^3 \ell(\theta)}{\partial \theta^3} \right]_{\theta_0} \]

\[ - \frac{x^4}{24T^2} \left[ \frac{\partial^4 \ell(\theta)}{\partial \theta^4} \right]_{\theta_0}. \]

It is shown that
\[ \text{Var}_{\theta_1}(Y_T) = 1 + \frac{1}{4T} b_1 + \frac{1}{T} b_2 + o(T^{-1}), \]

\[ \text{cum}_{\theta_1}(Y_T, Y_T, Y_T) = \frac{1}{4T} c_1 + \frac{1}{T} c_2 + o(T^{-1}), \]

\[ \text{cum}_{\theta_1}(Y_T, Y_T, Y_T, Y_T) = \frac{1}{T} d_1 + o(T^{-1}), \]
where

\[ b_1 = \frac{x}{I}(J+K), \quad b_2 = \left[\frac{x^2}{2T}\right](4L + 3M + 18N + 6H), \]
\[ c_1 = -\frac{K}{I^{3/2}}, \quad c_2 = -\left[\frac{x}{2T^{3/2}}\right](3N + 2H), \quad d_1 = \frac{H}{I^2}. \]

Taniguchi (1986, p. 15) derives the asymptotic expansions of \( Y_T \) under \( H \) and \( K \), up to \( O(T^{-1}) \), under fairly general regularity conditions discussed in detail therein. The results are:

\[
P_{\theta_1}(Y_T \leq a) = \Phi(a) - \phi(a) \left[ \frac{1}{2} \left( \frac{b_1}{6T} + \frac{b_2}{4T} \right) a + \left( \frac{c_1}{6T} + \frac{c_2}{6T} \right) (a^2 - 1) \right.
\]
\[
+ \left( \frac{d_1}{24T} + \frac{b_2}{8T} \right) (a^3 - 3a) + \frac{b_1 c_1}{12T} (a^4 - 6a^2 + 3)
\]
\[
+ \frac{C_1}{72T} (a^5 - 10a^3 + 15a) \right) + o(T^{-1})
\]

(13)

and

\[
P_{\theta_1}(Y_T \geq a) = \Phi(x') - \phi(x') - \Phi(x') \left[ \frac{\beta_2}{64T} + \frac{\beta_3}{64T} (x'^2 - 1) \right.
\]
\[
+ \left( \frac{\beta_2}{2T} + \frac{\beta_3}{72T} \right) x' + \left( \frac{\beta_4}{24T} + \frac{\beta_3}{96T} \right) (x'^3 - 3x')
\]
\[
+ \frac{\beta_2^2}{72T} (x'^5 - 10x'^3 + 15x') \right) + o(T^{-1})
\]

(14)

where \( x' = x(I_T) \) and \( \beta_3 = -(3J + 2K)/I^{3/2} \),

\[
\beta_4 = 3\beta_3^2 - (4P + 3M + 12N + 3H)/I^2,
\]
\[
\beta_2 = \frac{17}{36} \beta_3^2 - \frac{K^2}{18I^3} - \frac{12P + 9M + 36N + 8H}{12I^2}.
\]
4.2 Relation to Curvature Measures

When \( p = 1 \) in our model (1) and log likelihood (2), it is easy to show that general formulas of \( I, J, K, M, N, H, P \) are reduced as follows:

\[
I = \frac{1}{T \sigma^2} \sum_{t=1}^{T} f_t^{(1)}^2, \quad J = \frac{1}{T \sigma^2} \sum_{t=1}^{T} f_t^{(1)} f_t^{(1,1)}, \quad K = 0,
\]

\[
P = \frac{\sigma^2}{T} \sum_{t=1}^{T} f_t^{(1)} f_t^{(1,1,1)}, \quad M = \frac{1}{T \sigma^2} \sum_{t=1}^{T} f_t^{(1,1,1)}^2
\]

\[
N = \frac{\sigma^2}{T} \sum_{t=1}^{T} f_t^{(1)} f_t^{(1,1)}, \quad H = 0, \quad \Delta = 0.
\]

On the other hand, when \( p = 1 \) our \( V. \) and \( V.. \) defined in Section 3 are

\[
V. = \begin{bmatrix} f_1^{(1)} & f_2^{(1)} & \cdots & f_T^{(1)} \end{bmatrix}^\prime
\]

\[
V.. = \begin{bmatrix} f_1^{(1,1)} & f_2^{(1,1)} & \cdots & f_T^{(1,1)} \end{bmatrix}^\prime.
\]

Therefore we obtain

\[
LL^\prime = (V. V..)^{-1} = \frac{T}{\sum_{t=1}^{T} f_t^{(1)}^2}, \quad L = \left[ \frac{T}{\sum_{t=1}^{T} f_t^{(1)}^2} \right]^{-1/2},
\]

(15) \[ W. = V.L = \begin{bmatrix} f_1^{(1)} & f_2^{(1)} & \cdots & f_T^{(1)} \end{bmatrix}^\prime \left[ \sum_{t=1}^{T} f_t^{(1,1,1)}^2 \right]^{-1/2}, \]

(16) \[ W.. = L^\prime V..L = \begin{bmatrix} f_1^{(1,1)} & f_2^{(1,1)} & \cdots & f_T^{(1,1)} \end{bmatrix}^\prime \left[ \sum_{t=1}^{T} f_t^{(1,1)}^2 \right]^{-1/2}, \]

and

\[
A.. = (a_1^T, a_2^T, \ldots, a_T^T)^\prime. \quad (T \times 1)
\]

We can represent \( A.. \) in terms of \( W. \) and \( W.. \) as follows:
Lemma 3 For $p = 1$, we have

(a) \[ \left( a^T \right)^2 = \frac{1}{\sum_{t=1}^{T} f_t^2} \times \sum_{t=1}^{T} f_t^2 \left( f_t^1 \right)^2, \]

and

(b) \[ \sum_{t=2}^{T} \left( a_t^N \right)^2 = \frac{1}{\sum_{t=1}^{T} f_t^2} \times \sum_{t=1}^{T} f_t^2 \left( f_t^1 \right)^2. \]

Proof We can write as $A' A_.. = \left[ a^T_1 \right]^2 + \sum_{t=2}^{T} \left[ a^N_t \right]^2$, i.e., sum of parameter effect and intrinsic curvatures, and for $p = 1$, BW's definition of $A_..$ is reduced to

$A_.. = Q' W_.. = [W..|N]' W_..$, where $Q' Q = E_{T-1}$ (T×T identity matrix)

$A' A_.. = W_..' (W..' W.. + N' N) W_..$

$= W_..' (W..' W.. + E) W_..$ ['.' N' N = $E_{T-1}$, (T−1)×(T−1) identity matrix]

$= W_..' (W..' W..) W_.. + W_..' W_..$

Substituting (15) and (16), we have (a) and (b).

Using these relationships, we can write

\[ I = \frac{1}{T \sigma^2} L^{-2}, \quad J = \frac{L^{-3}}{T \sigma^2} \left[ a^T_1 \right], \quad K = 0, \]

\[ H = 0, \quad M = \frac{P^{-4}}{T \sigma^2} \left[ \left( a^T_1 \right)^2 + \sum_{t=2}^{T} \left( a^N_t \right)^2 \right]. \]

Note that $M$ includes the intrinsic curvature $\sum_{t=2}^{T} \left( a^N_t \right)^2$, and $N$ and $P$ can not be represented by $a^T_1$ and $a^N_t$.

Since asymptotic expansions of distributions of $Y_T$ is expressed by $I, J, K, ..., N$ as shown in eqs. (13) and (14), we observe:
Remark 1 The asymptotic expansions of distribution of LR test statistic (13) and (14) are affected by the intrinsic curvature through $M$ in $O(T^{-1})$ terms such as $b_2/T$ in (13) and $\beta_2/T$, $\beta_4/T$ in (14).

Remark 2 (13) and (14) contain terms $N$ and $P$ which are neither parameter effect nor intrinsic curvature. $P$ involve third order derivative $f_t^{(1,1,1)}$.

4.3 Expansion for MLE

Taniguchi (1986, p. 22, Theorem 3) also derived the third order asymptotic expansion for MLE $\hat{\theta}$ for $p=1$. It is represented by using $I$, $J$, ..., $N$ defined above:

\[
P \left\{ \sqrt{T} I (\hat{\theta} - \theta) \leq x \right\} = \phi(x) - \phi(x) \left[ \frac{\alpha_1}{T} + \frac{\gamma_1}{6T} (x^2 - 1) \right. \\
+ \frac{1}{2} \left[ \frac{\rho_2}{T} + \frac{\alpha_2}{T} \right] x + \left[ \frac{\delta_1}{24T} + \frac{\alpha_1 \gamma_1}{6T} \right] [x^3 - 3x] \\
+ \frac{\gamma_1^2}{72T} (x^5 - 10x^3 + 15x) \left] + o(T^{-1}), \right.
\]

where

\[
\alpha_1 = \frac{J + K}{2I^{3/2}},
\]

\[
\rho_2 = \frac{7J^2 + 14JK + 5K^2}{2I^3} - \frac{L}{I^2} + \frac{4N + H}{I} \frac{\Delta}{T}
\]

\[
\gamma_1 = \frac{3J + 2K}{I^{3/2}}, \delta = \frac{12(2J+K)(J+K)}{I^3} - \frac{4L}{I^2} + \frac{12N + 3H}{I^2}.
\]
Remark 3. Eq. (17) does not include M, hence the asymptotic expansion of distribution of MLE, $\{T(\hat{\theta} - \theta), \text{ up to } O(T^{-1})\}$ is not affected by intrinsic curvature.

Finally we check the relationship between BW's two curvatures and Effron's (1975) statistical curvature. The latter can be written by our notation as

$$\frac{1}{I(\theta)} E \left[ Z_2(\theta) - \frac{J(\theta)}{I(\theta)} Z_1(\theta) \right] = \gamma(\theta)$$

It is shown (Taniguchi and Taniguchi (1987)) that

$$\gamma(\theta) = \left( M(\theta) I(\theta) - J(\theta)^2 \right)^{1/2}/I(\theta)^{3/2}$$

where I, J, and M are defined in Section 4.1.

Since Effron's statistical curvature involves M which is essentially the sum of parameter effect and intrinsic curvature, it is not a property of parameterization.

5. Summary and Conclusions

Making use of the curvature measures introduced by Bates and Watts (1980), this paper has analyzed the effect of nonlinearity on MLE and LR test in a nonlinear regression model (1). First we developed the formal asymptotic expansion of distribution function of

MLE $\hat{\theta}$ (p×1) up to $O(1/T^{1/2})$, and tried to rewrite the resulting distribution function in terms of the parameter effect and intrinsic curvature defined by BW. As a result we found that the distribution of MLE, $\{T(\hat{\theta} - \theta), \text{ up to } O(T^{-1})\}$, is associated only with parameter effect curvature. Although BW emphasized that "to the extent of Box's bias approximation, bias is strictly a property of the parameterization", our finding allows us to generalize BW statement as such that the discrepancy from normality of distribution of MLE are strictly properties of the parameterization up to $O(T^{-1/2})$.

Second, we explored the third order asymptotic expansion of distribution of MLE and LR test statistic for a single parameter case, i.e., $\theta$ (1×1). Observing the resulting expansion we found that the distribution of LR is affected by both curvatures in a term of $O(T^{-1})$, while the distribution of MLE is not affected by the intrinsic curvature up to $O(T^{-1})$. However, we
noted that since the third order asymptotic expansions inevitably involves third order derivatives of nonlinear function $f(\cdot)$ in (1), contains other terms than curvatures which are a concept associated with second order derivative.

Finally we examined a relationship between BW's curvatures and Effron's statistical curvature and noticed that Effron's curvature is a mixture of parameter effect and intrinsic curvatures.
APPENDIX

Proof of Lemma 2. We only prove the third order cumulant. Let $\xi_{ij}$ be the $(i,j)$th element of $L^{-1}$.

Since $S = L^{-1} \sqrt{T} (\hat{\theta} - \theta) = L^{-1} \mathbf{U}$, an element $s_a$ in $S$ is

$$s_a = \sum_{i=1}^{p} \xi_{ai} u_i.$$ 

Therefore we have

$$\text{cum}(s_i, s_j, s_k) = \text{cum} \left( \sum_{h=1}^{p} \xi_{ih} u_h, \sum_{m=1}^{p} \xi_{jm} u_m, \sum_{n=1}^{p} \xi_{kn} u_n \right)$$

$$= \sum_{h} \sum_{m} \sum_{n} \xi_{ih} \xi_{jm} \xi_{kn} \text{cum}(u_h, u_m, u_n)$$

(A1) $$= \sum_{h,m,n} \xi_{ih} \xi_{jm} \xi_{kn} \sum_{a,b,c} I_{h,a} m_{b} n_{c} \langle J_{abc} + J_{bca} + J_{cab} \rangle + o(T^{-1})$$

where $I_{rs}, J_{rst}$ are defined in Theorem 3. Since we have (see BW eq. (2.24))

$$V' V = R' Q' Q R = R' R = \mathbf{R}^{-1} (\mathbf{L})^{-1},$$

and

$$I = \frac{1}{T \sigma^2} \sum_{t=1}^{T} f_t^{(i)} f_t^{(j)} = \frac{1}{T \sigma^2} V' V,$$

we obtain $I^{-1} = T \sigma^2 \mathbf{L}$, and $I^{mn} = T \sigma^2 \sum_{\beta} \ell_{m}^{\beta} \ell_{n}^{\beta}$. Substituting $I^{mn}$ and $J_{abc}$, we have

$$= \sum_{h,m,n} \xi_{ih} \xi_{jm} \xi_{kn} \sum_{a,b,c} I_{h,a} m_{b} n_{c} J_{abc}$$

$$= \sum_{h,m,n} \xi_{ih} \xi_{jm} \xi_{kn} \sum_{a,b,c} \alpha \beta \gamma \xi_{a} \xi_{b} \xi_{c} f_t^{(a)} f_t^{(b)} f_t^{(c)}$$

$$= \sum_{h,m,n} \xi_{ih} \xi_{jm} \xi_{kn} \sum_{a,b,c} \alpha \beta \gamma \xi_{a} \xi_{b} \xi_{c} f_t^{(a)} f_t^{(b)} f_t^{(c)}$$

$$= \sum_{h,m,n} \xi_{ih} \xi_{jm} \xi_{kn} \sum_{a,b,c} \alpha \beta \gamma \xi_{a} \xi_{b} \xi_{c} f_t^{(a)} f_t^{(b)} f_t^{(c)}$$
$$\begin{align*}
&= \sum_t \left[ \sum_{h,m,n} \epsilon^h \epsilon^m \epsilon^n \sum_{\alpha} \ell^h_{\alpha} \epsilon^{w_t}_{t\alpha} \sum_{\beta,\gamma} \ell^m_{\beta} \ell^\gamma_{\gamma} \epsilon^{w_t}_{t\beta} \right] \\
&= \sum_t \left[ \sum_{h, \alpha} \epsilon^h \epsilon^{h\alpha} \epsilon^{w_t}_{t\alpha} \sum_{m, n, \beta, \gamma} \epsilon^m \epsilon^m \ell^\beta_{\beta} \ell^\gamma_{\gamma} \epsilon^{w_t}_{t\beta} \right] \\
&= \sum_t \left[ \sum_{h, i} \epsilon^h \epsilon^i \epsilon^{w_t}_{t i} \sum_{m, j} \epsilon^m \epsilon^j \ell^m_{m j} \sum_{n, k} \epsilon^n \epsilon^k \ell^k_{n k} \epsilon^{w_t}_{tjk} \right] \\
&= \sum_t (w_{ti} w_{tjk}),
\end{align*}$$

where we use the relation $L^{-1}L = E$ or
\[
\sum_{i,j} \epsilon_{ij} \epsilon_{jk} = 0 \text{ if } i \neq j
\]
\[
= 1 \text{ if } i = j.
\]

Similarly we can calculate other two terms in (A.1) associated with $J_{bca}$ and $J_{cab}$. Finally we obtain $\text{cum}(s_i s_j s_k) = \sum_t (w_{ti} w_{tjk} + w_{tj} w_{tik} + w_{tk} w_{tij}) + O(T^{-\frac{1}{2}})$. Calculations of $\text{cum}(s_i)$ and $\text{cum}(s_i s_j)$ are entirely analogous.
REFERENCES

SUPPLEMENT

Proofs and derivations in this paper are largely dependant on the previous works, some of which are not easily accessible from outside of Japan because they are not published or written in Japanese. So I decided to write this supplement to give the details to interested readers and referees.

(1) Proof of Theorem 1

MLE \( \hat{\theta} \) is a solution of the first order condition \( \frac{\partial \ell(\theta)}{\partial \theta} = 0 \) (p×1). If we develop this equation in Taylor expansion about \( \theta = \hat{\theta} \) (p×1), we have

\[
0 = \frac{\partial \ell(\theta)}{\partial \theta} \bigg|_{\theta=\hat{\theta}} \\
= \frac{\partial \ell(\theta)}{\partial \theta} + \frac{\partial^2 \ell(\theta)}{\partial \theta \partial \theta} (\hat{\theta} - \theta) + \frac{1}{2} F_{\ldots} \circ (\hat{\theta} - \theta) \circ (\hat{\theta} - \theta)
\]

where \( F_{\ldots} \) is a p×p×p array with \((i,j,k)\)th element

\[
\frac{\partial^3 \ell(\theta)}{\partial \theta_i \partial \theta_j \partial \theta_k}
\]

and \( F_{\ldots} \circ (\hat{\theta} - \theta) \circ (\hat{\theta} - \theta) \) is a (p×1) column vector with \( i \)th element

\[
\sum_{k} \frac{\partial^2 \ell(\theta)}{\partial \theta_i \partial \theta_k} \left[ (\hat{\theta}_k - \theta)_k \right] \left[ (\hat{\theta}_k - \theta)_k \right].
\]

Therefore we have
\[ \sqrt{T}(\hat{\theta} - \theta) = \left[ \frac{1}{T} \frac{\partial^2 \ell(\theta)}{\partial \theta \partial \theta'} + \frac{1}{T} \frac{\partial^2 \ell(\theta)}{\partial \theta' \partial \theta} - E \left[ \frac{1}{T} \frac{\partial^2 \ell(\theta)}{\partial \theta \partial \theta'} \right] \right]^{-1} \left[ \frac{1}{\sqrt{T}} \frac{\partial \ell(\theta)}{\partial \theta} \right] \]

\[ - \frac{1}{2 \sqrt{T}} \left[ \frac{1}{T} \frac{\partial^2 \ell(\theta)}{\partial \theta \partial \theta'} \right]^{-1} \frac{1}{T} \mathcal{O}(\sqrt{T}(\hat{\theta} - \theta) + \sqrt{T}(\hat{\theta} - \theta)) \]

Substituting

\[ \frac{1}{T} E \left[ \frac{\partial^2 \ell(\theta)}{\partial \theta \partial \theta'} \right] = -I(\theta) + O(T^{-1}), \]

we obtain

\[ = \left[ I - I(\theta)^{-1} \frac{\partial^2 \ell(\theta)}{T} + O(T^{-1}) \right]^{-1} I(\theta)^{-1} Z_1(\theta) \]

\[ + \frac{1}{2 \sqrt{T}} I(\theta)^{-1} \mathcal{O}(\sqrt{T}(\hat{\theta} - \theta) + \sqrt{T}(\hat{\theta} - \theta)) \]

\[ \approx \left[ I + \frac{1}{\sqrt{T}} I(\theta)^{-1} Z_2(\theta) \right] + O(T^{-1}) I(\theta)^{-1} Z_1(\theta) \]

\[ + \frac{1}{2 \sqrt{T}} I(\theta)^{-1} \mathcal{O}(\sqrt{T}(\hat{\theta} - \theta) + \sqrt{T}(\hat{\theta} - \theta)) \]

Therefore we can write

\[ \sqrt{T}(\hat{\theta} - \theta) = I(\theta)^{-1} Z_1(\theta) + \frac{1}{\sqrt{T}} I(\theta)^{-1} Z_2(\theta) I(\theta)^{-1} Z(\theta) \]

\[ + \frac{1}{2 \sqrt{T}} I(\theta)^{-1} E \left[ \frac{\partial^3 \ell(\theta)}{T} \right] I(\theta)^{-1} Z_1(\theta) I(\theta)^{-1} Z_1(\theta) + o_p \left[ T^{-\frac{3}{2}} \right]. \]

By taking \(i^{th}\) element out, we obtain Eq.(4) in Theorem 1.

(2) A general formula of Edgeworth type asymptotic expansion used in Theorem 2.
Let $Y_T = (Y_1, Y_2, \ldots, Y_p)$ were $Y_j$ is a random variable, and suppose they have cumulants such as

$$E(Y_j) = \frac{c_j}{\sqrt{T}} + o\left[T^{-\frac{1}{2}}\right],$$

$$\text{cum}(Y_j, Y_k) = c_{jk} + o\left[T^{-\frac{1}{2}}\right],$$

$$\text{cum}(Y_j, Y_k, Y_{k'}) = \frac{c_{jkl}}{\sqrt{T}} + o\left[T^{-\frac{1}{2}}\right].$$

Then the asymptotic expansion of joint distribution of $Y_j$, up to $O\left[T^{-\frac{1}{2}}\right]$, is given by

$$P(Y_1 \leq y_1, Y_2 \leq y_2, \ldots, Y_p \leq y_p)$$

$$= \int_{\infty}^{\gamma_1} \cdots \int_{\infty}^{\gamma_p} g(y, \Omega) \left[1 + \frac{1}{\sqrt{T}} \sum_{i=1}^{p} c_i H_i(y) + \frac{1}{6\sqrt{T}} \sum_{i,j,k=1}^{p} c_{ijk} H_{ijk}(y) \right] dy_1 \cdots dy_p$$

where $H_i$, $H_{ijk}$ are Hermite polynomials:

$$H_{j_1 j_2 \cdots j_s} (y) = \frac{(-1)^s}{g(y, \Omega)} \frac{\partial^s}{\partial y_{j_1} \cdots \partial y_{j_s}} g(y, \Omega),$$

$$g(y, \Omega) = (2\pi)^{-P/2} |\Omega|^{\frac{1}{2}} \exp\left[\frac{-1}{2} y^\prime \Omega y\right],$$

$$y = (y_1, \ldots, y_p)^\prime.$$

For a more general case, see Taniguchi (1986, Eq. (3.8)).
Proof of Theorem 3

Derivatives of \( \ell(\theta) \) wrt \( \theta_i \) up to third order are given by

\[
\frac{\partial \ell(\theta)}{\partial \theta_i} = \frac{1}{\sigma^2} \sum_t (y_t - f(x_t, \theta))f_i^{(k)} = \frac{1}{\sigma^2} \sum_t \varepsilon_t f_i^{(k)}
\]

where \( y_t - f(x_t, \theta) = \varepsilon_t \). Similarly

\[
\frac{\partial^2 \ell(\theta)}{\partial \theta_i \partial \theta_j} = -\frac{1}{\sigma^2} \sum_t f_t^{(k)} + \frac{1}{\sigma^2} \sum_t \varepsilon_t (f_t^{(k)} - f_t^{(i,k,\ell)})
\]

\[
\frac{\partial^3 \ell(\theta)}{\partial \theta_i \partial \theta_j \partial \theta_k} = -\frac{1}{\sigma^2} \sum_t \left[ f_i^{(k)} + f_j^{(k)} - f_i^{(i,k,\ell)} + \varepsilon_t f_t^{(i,k,\ell)} \right]
\]

As is defined in Section 2, we have

\[
z_{1i} = \frac{1}{\sqrt{T}} \frac{\partial \ell(\theta)}{\partial \theta_i},
\]

\[
Z_{2k\ell} = -\frac{1}{\sqrt{T}} \left[ \frac{\partial^2 \ell(\theta)}{\partial \theta_k \partial \theta_\ell} - \mathbb{E} \left[ \frac{\partial^2 \ell(\theta)}{\partial \theta_k \partial \theta_\ell} \right] \right].
\]

Substituting (3.1) and (3.2) into (3.4) and (3.5), we have

\[
\mathbb{E}(z_{1i}) = \frac{1}{\sigma^2} \sum_t \mathbb{E}(\varepsilon_t) f_t^{(i)} = 0,
\]

\[
-\mathbb{E} \left[ \frac{\partial^2 \ell(\theta)}{\partial \theta_k \partial \theta_\ell} \right] = \frac{1}{T \sigma^2} \sum_t f_t^{(k)}.
\]

By definition
\[ J_{ik\ell}(\theta) = \text{cov}(z_{1i}, z_{2k\ell}) \]
\[ = \mathbb{E}[(Z_{1i} - \mathbb{E}(Z_{1i}))(Z_{2k\ell})] \]
\[ = \mathbb{E}(z_{1i}z_{1k}z_{1\ell}) \]

Substituting (3.4)–(3.7) into (3.8), and using \( \mathbb{E}\left[\varepsilon_t^2\right] = \sigma^2 \), \( \mathbb{E}(\varepsilon_t, \varepsilon_s) = 0 \) for \( s \neq t \), we obtain

\[ J_{ik\ell}(\theta) = \frac{1}{T_0^4} \mathbb{E}\left[ \sum_{t} \varepsilon_t f_t^{(i)} \right] \sum_{t} \left[ f_t^{(k)} f_t^{(\ell)} + u_t f_t^{(k)} + f_t^{(\ell)} f_t^{(k)} \right] \]
\[ = \frac{1}{T_0^2} \sum_{t} f_t^{(i)} f_t^{(k, \ell)}. \]

Next we calculate \( K_{ik\ell}(\theta) \) and \( R_{ik\ell}(\theta) \):

\[ K_{ik\ell}(\theta) = \text{cum}(z_{1i}, z_{1k}, z_{1\ell}) \]
\[ = \mathbb{E}(z_{1i}z_{1k}z_{1\ell}) \]
\[ = \frac{1}{T_0^6} \mathbb{E}\left[ \sum_{t} \varepsilon_t f_t^{(i)} \right] \left[ \sum_{t} \varepsilon_t f_t^{(k)} \right] \left[ \sum_{t} \varepsilon_t f_t^{(\ell)} \right] \]
\[ = 0 \quad (\because \mathbb{E}(\varepsilon_s, \varepsilon_t, \varepsilon_s) = 0) \]

\[ R_{ik\ell}(\theta) = \frac{1}{T_0^4} \frac{\partial^3 \ell(\theta)}{\partial \theta_i \partial \theta_k \partial \theta_{\ell}} \]
\[ = -\frac{1}{T_0^2} \sum_{t} \left[ f_t^{(i)} f_t^{(k, \ell)} + f_t^{(\ell)} f_t^{(k, i)} + f_t^{(i)} f_t^{(k, \ell)} \right] \]

(4) **Representation of \( A_{..} \)**

For illustrative purpose, the representation of \( A_{..} \) is shown for \( p=2 \), and \( T=3 \). \( A_{..} \) is defined by
\[
\frac{1}{2}Q^\prime (\phi - \phi_0) \cdot W..(\phi - \phi_0) = \frac{1}{2} \begin{bmatrix} (\phi - \phi_0)^\prime A_1..(\phi - \phi_0) \\ (\phi - \phi_0)^\prime A_2..(\phi - \phi_0) \\ (\phi - \phi_0)^\prime A_3..(\phi - \phi_0) \end{bmatrix},
\]

where \( W.. = L^\prime V..L \) is defined in Section 3.

Set \((\phi - \phi_0) = a = (a_1,a_2)^\prime \) and \( Q = \{q_{ij}\}, i,j = 1,2,3. \) Then we can write

\[
Q^\prime (\phi - \phi_0) \cdot W..(\phi - \phi_0) = Q^\prime \begin{bmatrix} a^\prime W_1..a \\ a^\prime W_2..a \\ a^\prime W_3..a \end{bmatrix}
= \begin{bmatrix} q_{11}(a^\prime W_1..a) + q_{12}(a^\prime W_2..a) + q_{13}(a^\prime W_3..a) \\ q_{21}(a^\prime W_1..a) + q_{22}(a^\prime W_2..a) + q_{23}(a^\prime W_3..a) \\ q_{31}(a^\prime W_1..a) + q_{32}(a^\prime W_2..a) + q_{33}(a^\prime W_3..a) \end{bmatrix}
= \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}, \text{ say.}
\]

For instance we have

\[
x_1 = q_{11}\left[a_1^2 w_{111} + a_1 a_2 w_{112} + a_2 a_1 w_{121} + a_2^2 w_{122}\right] \\
+ q_{12}\left[a_1^2 w_{211} + q_{12} w_{211} + a_2 a_1 w_{221} + a_2^2 w_{222}\right] \\
+ q_{13}\left[a_1^2 w_{311} + a_1 a_2 w_{312} + a_2 a_1 w_{321} + a_2^2 w_{322}\right] \\
= a_1^2\left[q_{11} w_{111} + q_{12} w_{211} + q_{13} w_{311}\right] \\
+ a_1 a_2\left[q_{11} w_{112} + q_{12} w_{212} + q_{13} w_{312}\right] \\
+ a_2^2\left[q_{11} w_{121} + q_{12} w_{221} + q_{13} w_{321}\right]
\]
\[ a_2^2 \left( q_{11}w_{122} + q_{12}w_{222} + q_{13}w_{322} \right) \]

Similarly we can calculate \( x_2 \) and \( x_3 \). Substituting those \( x_1 \), \( x_2 \), and \( x_3 \), we obtain

\[
\begin{bmatrix}
    a' A_{1..} a \\
    a' A_{2..} a \\
    a' A_{3..} a
\end{bmatrix}
\]

(4.2)

where \( A_{i..} \) is the \( i \)th face of \( A_{..} \), i.e.,

\[
A_{..} = \begin{bmatrix}
    A_{2..} \\
    A_{3..}
\end{bmatrix}
\]

Form the definition of \( Q \), the first \( p \) columns of \( Q \) are \( w_{1..}, \ldots, w_{p..} \) (see eq. (2.13) in BW), so we have

\[
Q = \begin{bmatrix}
    w_{11} & w_{21} & q_{31} \\
    w_{12} & w_{22} & q_{33} \\
    w_{13} & w_{23} & q_{33}
\end{bmatrix}
\]

for \( p=2 \) and \( T=3 \).

Therefore we have

\[
A_{i..} = \begin{bmatrix}
    \Sigma_{w_{t11}} w_{t11} & \Sigma_{w_{t12}} w_{t12} \\
    \Sigma_{w_{t21}} w_{t21} & \Sigma_{w_{t22}} w_{t22}
\end{bmatrix}
\]

for \( i = 1, 2 \).
and

\[ A_{3t} = \begin{bmatrix} \sum_{t} w_{3t} w_{t11} & \sum_{t} w_{3t} w_{t12} \\ \sum_{t} w_{3t} w_{t21} & \sum_{t} w_{3t} w_{t22} \end{bmatrix} \]
